

Julius Zhang

juliuszh@alumni.stanford.edu

EXPERIENCE

a16z	Researcher, 2025.4 - Present
- Building Jolt, open-source zero-knowledge virtual machine in Rust. - Implemented and benchmarked torus compression; proved optimality with a conceptual reframing via Hilbert 90. Audited elliptic-curve optimizations, formalizing folklore results into rigorous proofs. - Performance engineering across the proving stack, including sum-check optimization.	
Millennium	Researcher, 2024.6 - 2025.4
Convex optimization and robust statistical estimation for real-time trading systems.	
Stellar Development Foundation	Consultant, 2023.6 - 2023.9
- Byzantine fault tolerance, C++, stellar-core. - Performance optimization: improved maximum transaction rate per second by 17% via changes to the consensus protocol, reducing number of communication rounds in overlay network. Formal verification in TLA+.	
Distributed Systems and TCS Research, Stanford University	Researcher, 2023.9 - 2024.6
- Under David Mazieres, research in general open membership Byzantine fault tolerance protocols (Github), with applications to certificate authority management and automatic password recovery with hardware security modules. - Research PCP under Aviad Rubinfeld, presented full proof of the 2-to-2 Games Conjecture. Proved a result about Convex Continuous Class Complexity.	
Topology Research, Stanford University	Researcher, 2020.7 - 2022.5
- Floer homotopy theory under Mohammed Abouzaid; related the complex cobordism Gysin map to the Grothendieck residue symbol and derived a recursive formula for Gromov–Witten quantum product corrections. - Research under Ciprian Manolescu. Floer theory, Seiberg-Witten, knot invariants. Produced new potential counterexamples for the smooth Poincare conjecture.	

SELECTED PAPERS AND MANUSCRIPTS

- The Trace-Zero Subgroup and the Relative Trace for BN254,**
Julius Zhang,
2026.
[pdf](#)
- Complex Cobordism and Formal Group Law,**
Julius Zhang,
Manuscript (Undergraduate Honours Thesis), Stanford University, 2024.
[pdf](#)

TALKS

- p -Ordinary Cohomology for $SL(2)$ over Number Fields (after Hida),**
Hida Theory Seminar, Columbia University, 2026.

EDUCATION

Courant Institute of Mathematical Sciences, New York University, computer science <i>PhD</i> .	starting 2026.9
Verifiable systems and theoretical computer science.	
Stanford University, computer science <i>M.S.</i> and mathematics <i>B.A.</i>	2019.9 - 2024.6
General Yaowu Wang Scholarship.	

SKILLS

Computer Science: Rust, C/C++, Python, formal verification, convex optimization, distributed systems, cryptographic protocol design, performance engineering.

Mathematics: number theory, algebraic geometry, symplectic topology, homotopy theory, Floer theory, gauge theory, concentration inequalities.
